## **Kein LAN & Recovery Freeze**

**Beitrag von „djangomango666“ vom 19. Januar 2020, 11:54**

Ok!

Auf github schreibt er folgende installation:

Before you install the driver you have to remove any installed driver for RTL8111/8168.

- Goto /S/L/E and delete the old driver (Lnx2mac, AppleRealtekRTL8169, etc.).
- Recreate the kernel cache.
- Open System Preferences and delete the corresponding network interface, e. g. en0. If you forget this step you might experience strange problems with certain Apple domains, iTunes and iCloud later.
- Reboot.
- Install the new driver and recreate the kernel cache.
- Reboot
- Open System Preferences again, select Network and check if the new network interface has been created automatically or create it manually now.
- Configure the interface

Muss ich all diese schritte durchführen? Ist das ein kext der in den system muss und nicht in den efi?
