

Beim Start sofort Fehlermeldung

Beitrag von „al6042“ vom 16. Februar 2020, 15:05

Wenn Einträge nicht dediziert gesetzt werden, gelten die sogenannten "Failsafe"-Werte.

Laut Configuration.pdf stehen die Failsafes für beide Einträge auf "true" (YES) und sind somit standardmäßig aktiv:

```
6. RequireSignature
Type: plist boolean
Failsafe: true
Description: Require vault.sig signature file for vault.plist in OC directory.
This file should contain a raw 256 byte RSA-2048 signature from SHA-256 hash of vault.plist. The signature
is verified against the public key embedded into OpenCore.efi.
To embed the public key you should do either of the following:
  • Provide public key during the OpenCore.efi compilation in OpenCoreVault.c file.
  • Binary patch OpenCore.efi replacing xeros with the public key between -BEGIN OC VAULT- and ==END
  OC VAULT== ASCII markers.
RSA public key 520 byte format description can be found in Chromium OS documentation. To convert public
key from X.509 certificate or from PEM file use RosTool.
Note: vault.sig is used regardless of this option when public key is embedded into OpenCore.efi. Setting it
to true will only ensure configuration sanity, and abort the boot process when public key is not set but was
supposed to be used for verification.

7. RequireVault
Type: plist boolean
Failsafe: true
Description: Require vault.plist file present in OC directory.
This file should contain SHA-256 hashes for all files used by OpenCore. Presence of this file is highly recommended
to ensure that unintentional file modifications (including filesystem corruption) do not happen unnoticed. To
create this file automatically use create_vault.sh script.
Regardless of the underlying filesystem, path name and case must match between config.plist and vault.plist.
Note: vault.plist is tried to be read regardless of the value of this option, but setting it to true will ensure
configuration sanity, and abort the boot process.
```
