

Ozmosis mit macOS Catalina 10.15 - OZ167X-XMAX (extended)

Beitrag von „kuckkuck“ vom 23. Februar 2020, 13:28

[mun1983](#) A few things:

1. Please read this request and provide the information that I need to take care of the issue. A picture of a white display will not help me to write a Kernel Patch if necessary.

Zitat von kuckkuck

Please attach a picture of your Verbose Boot Error Message and attach the kernel that you are using

Verbose is triggered by using -v as a bootarg. The Kernel is found in /System/Library/Kernels.

2. I didn't ask for your ROM but taking a quick look at it I couldn't find any device property injection. Also your defaults.plist is implemented incorrectly. The defaults shouldn't be stored inside a PE32 image, but instead inside a Raw Section! Please take a look at the files provided in the first post.

3. Please stop abusing the report function of this forum. You don't have to report my posts to answer them, you can just write a message in this thread and I will read it and take care of the issue when I am free.
