

Airdrop aktivieren (nicht "kompatible" Mac's und Hackintosh's

Beitrag von „THANATOS81“ vom 18. September 2011, 12:04

Hallo Freunde des selbstgebauten Mac's

Auch wenn ich finde das hier ein recht rauer Ton im Forum herrscht will ich euch meine neuste Erkenntnis nicht vorenthalten (hatte mir schon überlegt ob ich mich nicht abmelde).

Habe auf macworld.com einen Artikel entdeckt in dem steht, wie man Airdrop auch an nicht kompatiblen Macs mit Lion aktiviert.

Funktioniert auf meinen Hackintoshs einwandfrei.

10.7: Enable AirDrop on Macs without supported wireless hardware

AirDrop is a handy way to share files between Macs. Unfortunately, it is only supported on newer models which have the hardware necessary to support a certain type of point-to-point WiFi connection. There is, however, a hidden setting to enable AirDrop on older Macs. Just type:

```
defaults write com.apple.NetworkBrowser BrowseAllInterfaces 1
```

into a Terminal window, hit enter, and relaunch the Finder.

Note that:

You must do this on both the sending and receiving macs, even if one of them already has the correct WiFi hardware (I think).

You will be able to see other macs on the same network, and they will be able to see your Mac (when AirDrop is open), even if they are not physically nearby. On a larger network with many Macs, this could potentially cause some confusion, although it shouldn't be a real security issue. This may be why Apple decided not to enable this feature by default.

Both macs must be connected to the same network somehow (ethernet, existing WiFi network, etc.)

Fröhliches Airdropping 😊
