

OpenCore-Tool zum Abgleich der bspw. sample.plist - config.plist

Beitrag von „Ortie“ vom 3. April 2020, 18:14

[karacho](#)

ich hatte die Release von OC installiert.

Der Wert 67 ist hier vorgegeben:

<https://khronokernel-2.gitbook...d-config.plist/amd-config>

Debug: Helpful for debugging OpenCore boot issues.(We'll be changing everything but `displayLayout`)

- **DisableWatchDog:** YES (May need to be set for YES if OpenCore is stalling on something while booting, can also help for early macOS boot issues)
- **Target:** 67
 - Shows more debug information, requires debug version of OpenCore
- **DisplayLevel:** 2147483714
 - Shows even more debug information, requires debug version of OpenCore

These values are part of those mentioned in [OpenCore release notes](#)
