

Erledigt Embedded Ryzen Board

Beitrag von „maxman“ vom 21. April 2020, 11:27

Ach schade die kleineren Vegas sind wohl wirklich nicht zu empfehlen:

"

The integrated GPU found on lower end AMD CPUs have unfortunately never had official support with community support quite lacking. While possible to get a display out with some work, graphics acceleration is basically impossible making these APUs more of a hazard to macOS.

Unsupported APUs:

- Vega 11(Zen)
- Vega 8(Zen)

"
