

# Alienware m15 R1 - Dual GPU Gaming Notebook - lauffähige Konfiguration (EFI inside)

Beitrag von „motel hotel“ vom 7. Mai 2020, 00:50

hi [elmacci](#), I don't know if you are going to read this but I need your help.

I have a Alienware M15 R1, i7-8750H, GTX 1060 6gb, Ram 16gb.

I know that you have mentioned that Thunderbolt is not working, but I have found out that a lot of HACKINTOSH LAPTOP's with thunderbolt is using there thunderbolt to connect to an eGPU without problem.

And I need that to connect with my monitor.

Please can you help me?

I did some research and got some help from other community but still not working.

Since I have used your EFI to get the Mac OS working I thought that you could help me.

I'm attaching my EFI.

Please can you give a look and help me out with this?

Many thanks.
