hi <u>elmacci</u> , I don't know if you are going to read this but I need your help.
I have a Alienware M15 R1, i7-8750H, GTX 1060 6gb, Ram 16gb.
I know that you have mentioned that Thunderbolt is not working, but I have found out that a lot of HACKINTOSH LAPTOP's with thunderbolt is using there thunderbolt to connect to an eGPU without problem.
And I need that to connect with my monitor.
Please can you help me?
I did some research and got some help from other community but still not working.
Since I have used your EFI to get the Mac OS working I thought that you could help me.
I'm attaching my EFI.
Please can you give a look and help me out with this?
Many thanks.
