

[Guide] Remove EFI partition from drives without harming contents

Beitrag von „poof“ vom 12. Juni 2020, 13:56

Oef, I also had trouble with Ozmosis and the EFI partition it picks for local files. They should have added a test to see if one of the EFI partition already has an OZ folder and load that.

The problem I'm in now is that I formatted my M.2 drive from NTFS to APFS and suddenly MacOS wouldn't boot correctly. I first thought the boot loader wasn't able to handle the APFS format, but formatting it to HFS+ didn't solve it.

To my surprise (and thanks to your post) I found out Ozmosis now picked the M.2 drive's EFI partition for the OZ local files. I guess on my board the M.2 drive is available first... So now I'm just going to copy my OZ files there and hopefully this will solve my problem.

If I don't come back here, it did 😊
