# Gigabyte GA-Z77X-UD3H/DSDT/KEXTE und mehr

Beitrag von „al6042“ vom 18. Juli 2020, 13:01

Since the thread is almost four years old, therefore comes from a time where DSDTs were more in focus, the here mentioned package was a good and helpful addition.

Now most of the necessary DSDT-Patches are automatically insert via kexts and/or the modern bootloaders.

Others were just use for "cosmetic" reasons, e.g having the list of internal PCI-Devices in the "PCI"-section of System Report, like shown in the following pic:

Card	Type	Driver Installed
ATI	gpu-controller	Yes
Apple Pay	Audio device	Yes
Audio	Network controller	Yes
Bluetooth	Audio device	Yes
Camera	Communication controller	No
Card Reader	SATA controller	Yes
Controller	SATA controller	Yes
Diagnosics	RAM memory	No
Disk Burning	WiFi	No
Ethernet Cards	Serial bus controller	No
Fibre Channel	USB controller	Yes
Flash	Non-volatile memory controller	Yes
Flash	Non-volatile memory controller	Yes
Graphics/Display	Ethernet controller	Yes
Memory	Non-volatile memory controller	Yes
WiFi/Network	Non-volatile memory controller	Yes
PCI	Non-volatile memory controller	Yes

While you're using OpenCore I wouldn't advice to use the DSDT in your case.
