Just FakeSMC, or Kexts aren't injected in general?

In some instances it loaded the kx audio driver (which i use for my sound card) but it seems to me that important kexts are not loaded, i will try different configurations to try to have kexts loaded, but for now i don't see any loaded kexts

EDIT:

I switched back to clover 5119 modded version and to use the config.plist kernel patches and it seems that i have kext injection back i am still trying with different kext combinations. About the kernel panic if you read the symbols it looks like an error when retriving some pci device/pci bus features, so perhaps a custom ssdt is needed afterall? wiredly it's just a big sur problem, for sure some stuff about how the os treats pci devices has changed

EDIT 2:

Even with kext injection working and fakesmc or virtual smc loaded i still get the same kernel panic, so has anyone ever tried installing big sur on x99 using clover with any success?
