Hi! Had a couple of questions as I'm considering this particular laptop

(Dell XPS 17 9700 i7-10875H NVIDIA GeForce® RTX 2060 6GB 1TB M.2 PCIe NVMe)

and turn it into a triple-boot hackintosh.

It is in a higher price range, my budget is just enough for it and therefore I want to protect myself with the following questions:

The tutorial from "vivandi" is exactly what I was looking for. Great work! Thank you for that first.

To 4. (dual boot with Win10).

1) Would a **triple boot** with **MacOs** , **Windows** and a **Linux -Distro** (e.g. Ubuntu) be possible without further ado (e.g. create additional partitions in the disc utility)?

2) **Does** the **touchscreen work** immediately after installation in MacOS or are there **any** additional settings or **kexts** or something similar?

3.) Do you now need another special **WiFi card** (e.g. DW 1830/1560) or is that no longer necessary so that the onboard WiFi card works out-of-the-box?

LG

Dominik

Thanks in advance to everyone who is involved in this topic!

- 1) My suggestions is install macOS on second ssd(xps 15 and 17 have two m.2 slots) and on another you can safely use native win and linux without problem.
- 2) As I know additional kexts need.
- 3) Look at wifi kexts in [Vivandi](#) tutorial, built in wifi and bt should work with this.
