

# RadeonBoost.kext - Benchmark Scores wie am echten Mac / unter Windows

Beitrag von „kexterhack“ vom 28. August 2020, 17:18

[chell](#)

The Radeon Boost kext is just for getting closer to the original value in e.g. geekbench metalscore achievement.

Without the kext some (Polaris) Cards might underperform; at least not reach the expected score in geekbench.

Like the others mentioned already, this kext isn't suitable for the Navi architecture at the moment.
