News:

About the diagnostics mode issue, the script files are now dynamically created into the ~/Application Support folder which is freely accessible by any app and so there should no longer be a problem with it, and also the diagnostics mode is prompted just when needed, which is on catalina and newer version with [SIP](#) enabled.

By the end of the month the new beta 4, which includes this fix and way more stuff will be out for all of you to use, i still have to work some stuff regarding implementation of a multiple language system, but it's almost completed, i will have to implement it in a few views and messages, i have also uploaded a preview version to let you try the fixes for the bugs, enjoy:

https://mega.nz/file/K4BHHAQJ#...laaMkJVrfo4AL63WMLII_Wz6M

Note that this isn't officially the beta 4, but it's just a little thing to let you try the fixes, much of the work has been done under the hood to improve the app, so there aren't a lot of new things you can see in the UI in this version
