

Audio issus on Catalina

Beitrag von „karacho“ vom 6. Oktober 2020, 18:14

I suggest, you open current Hackintool, above klick PCI and below the Export Icon. After this you'll find some generated files. One of them is PciDevices.plist. Load this file and your current config.plist with PlistEdit Pro. In PciDevices.plist expand the device tree to find the PCI Adress of your Audio Device, drag&drop this tree into your already opened config.plist to DeviceProperties->Add. Make sure not to paste it into an already existing Device tree. After this you can play and test with different alcid's in bootargs.
