

# [Sammelthread] MacOS BigSur 11.0 DEV-Beta Erfahrungen

Beitrag von „Raptortosh“ vom 17. Oktober 2020, 09:26

Müsste an sein, für safe Mode. Bin mir aber nicht sicher, ob das auch das Kext injection Problem löst...

```
6. ProvideCustomSlide
Type: plist boolean
Fallback: false
Description: Patch bootloader to have KASLR enabled in safe mode.

This option is relevant to the users that have issues booting to safe mode (e.g. by holding shift or using -x boot argument). By default safe mode forces 0 slide as if the system was launched with slide=0 boot argument. This quirk tries to patch boot.efi to lift that limitation and let some other value (from 1 to 255) be used. This quirk requires ProvideCustomSlide to be enabled.

Note: The necessity of this quirk is determined by safe mode availability. If booting to safe mode fails, this option can be tried to be enabled.
```
