tnx, going to try it this evening and keep you posted. Appreciate your help.

( ps The SSDT was original i pulled from the Thunderbolt thread on this forum and only changed the device path as DSM2 suggest in his manual) . But not familiar with ssdts

Update:

Just tested and it does something for sure, but it wipes thunderbolt completely now.

Added hackintool pci devices export so you can check my hardware paths as something is not matching up in the aml, but dont understand enough to judge.
