

ProperTree - Tool zum Erstellen von Snapshots für OpenCore Konfigurationen

Beitrag von „KMac“ vom 16. Dezember 2020, 10:54

[errut](#) von der github-Seite...:

- ProperTree crashes on Big Sur (macOS 11)

This is due to the default python installs on macOS leveraging an older `tk` version - which lacks support for macOS 11. To solve this, you can download and install the latest python 3 version from <https://www.python.org/downloads/mac-oss/> then leverage the `buildapp-python3.command` from ProperTree's `Scripts` directory to build a .app bundle that will leverage that python version.

If you already have python 3 installed via `brew` or another package manager - it is likely still linking to the system `tk` version, which will still have issues unless linked against a newer version.
