

Ozmosis mit macOS Catalina 10.15 - OZ167X-XMAX (extended)

Beitrag von „Pelikan213“ vom 30. Dezember 2020, 18:08

Hi!

I would like to thank you for the work done and congratulate you on the upcoming holidays!

I'm building a new system now and want to install Ozmosis + Catalina + Windows 10

Mobo Gigabyte z97xGaming7, i7-4790k, 32gb ram, and Gigabyte Radeon Vega56

Have few questions about this:

1. Do I need to use ACPI Patcher if I'll patch dsdt/ssdt?

For example ACPI.plist from Z97D3H.F9_XMAX-Cata.rom (KuckKuck) had PatchOEMTableOnly and no change EHC1 to EH01 etc ...

2. KernnextPatcher_10.15.4 Ready.ffs work well for Catalina 10.15.7?

3. I read first post about OsxAptioFix2Drv work ok with z97, mhm so there is no need to change it to AptioMemoryFix or AptioFix3?

4. Anyone use Darboot in Ozm z97? I don't see it in KuckKuck Ozm, Konovalov didnt use it, but I think if I want to use 2 system better to put it in Ozm....

This setup for Darboot is correct? Attached picture
