Ozmosis mit macOS Catalina 10.15 - OZ167X-XMAX (extended)

Beitrag von „Raptortosh“ vom 30. Dezember 2020, 20:04

1. APFSDriverLoader is no kext, but yes, it works for 10.15.7.
2. Doesn't matter, both work. VirtualSMC is newer than FakeSMC.
3. Look there: [AppleALC into Bios - Ozmosis | InsanelyMac](#) This is small AppleALC, but don't know if still works. Or just use VoodooHDA. Why do you put all KEXTs into BIOS? You can just copy KEXTs to EFI/OZ/Darwin/Extensions/Common.
