

Grafikkarte AMD RX550 aktivieren CATALINA 10.15.7

Beitrag von „MPC561“ vom 26. Februar 2021, 12:55

Most 550s will **not** work except for some models like [Sapphire Pulse 550 640 SP](#)

as most other 550s are Lexa core, while 640 SP variants are Polaris. See below for more info

As mentioned above, RX 550 models come in 2 flavours known as Baffin and Lexa. The former is officially supported in macOS however the latter is not. Here we have a simple breakdown explaining how to determine which GPU is Baffin and which is Lexa even if OEMs do not openly mention.

Specification differences:

- **Old Lexa Core (incompatible):**
 - Stream Processors 512 (CUs )
 - Memory Speed 1750MHz (7000Mz effective)
 - Reference Clock 1183MHz
- **Newer Baffin Core (compatible)**
 - Stream Processors 640 (CUs 10)
 - Memory Speed 1500MHz (6000Mz effective)
 - Reference Clock 1071MHz

PCI ID Differences:

- Cards with the [Device ID of 0x67ff](#)
[\(opens new window\)](#) should be supported OOB
 - Device ID 0x699f = RX 550 512SP
 - Device ID 0x67ff Rev FF = RX 550 640SP
 - Device ID 0x67ff Rev CF = RX 560
