

[Sammelthread] MacOS BigSur 11.0 DEV-Beta Erfahrungen

Beitrag von „henties“ vom 16. März 2021, 18:42

Habe mich nun mal wieder ausnahmsweise entschieden, um trotz dessen das ich mich vor einigerZeit entschlossen habe hier nicht mehr aktuell teilzunehmen, wegen viel zu starker typisch "Deutscher Überheblichkeit", die hier in diesen Forum von vielen langjährigen Teilnehmern verankert ist, nun trotzdem wider einen Beitrag in English zu liefern, danach ist natürlich wieder Feierabend, Begründung zu den Beschluss dies hier zu posten überlasse ich eueren Spekulationen.

For the GA-Z490 Vision G platform, a [Bios update](#) to version F20d from F20a is available.

After applying this [BIOS update](#) I noticed that thermally the mobo is not taxed as exhaustively as was the case under Bios F20a, a differential of approximately 10 degrees was noticed during testing with

Geekbench 5.

The recorded temperatures with the new F20d BIOS never exceeded 80 degrees C wherever under the previous BIOS, temperatures hovered around 90 degrees C during some of these tests, consequently this is a BIOS upgrade I highly recommend for everybody using the Gigabyte Vision G platform, particularly when considering that for every 10 degrees C lower operating temperatures electronics can be made to run "cooler" the mtbf (mean time before failure) is basically doubled. Everybody likes to live as long as possible, even electronics per se

The attached screenshots tell the whole story.

Greetings and goodbye Henties
