

HILFE bei meinem Hackintosh

Beitrag von „Erdenwind Inc.“ vom 28. März 2021, 20:33

check im Bios mal folgendes...

Disable:

- Fast Boot

- VT-d(can be enabled if you set DisableIoMapper to YES, AMD users will need to disable SVM in the BIOS)

- CSM

- Thunderbolt

- Intel SGX

- Intel Platform Trust

- CFG Lock(MSR 0xE2 write protection)

-If this can't be turned off in the BIOS(or even found) please consider patching it out. See Fixing CFG Lock for more info. AMD CPU users don't need to worry about.

Enable:

- VT-x

- Above 4G decoding

- Hyper-Threading

- Execute Disable Bit

- EHCI/XHCI Hand-off

- OS type: Windows 8.1/10 WHQL Mode

- Legacy RTC Device(Relevant for Z370+)
