Ich nutze LILU, aber kein WEG. MacPro7,1.

Habt ihr da auch manchmal Probleme beim HDMI/DP Soundausgang?

I don't use HDMI/DP sound (only USB). But when I tested without WEG I noticed a connection problem on the USB-C connector: from boot, and after wake, often the monitor connected to USB-C would not get a picture. Booting with WEG (and agdpmod=pikera boot-arg) fixed this.

Even though WEG does not yet know about the 6000-series cards, it has a lot of general fixes, including fixing connectors. My recommendation is to test with WEG and see if this fixes the issue. I don't yet know of any downside to having WEG running with the 6900XT.
