

BigSur, Catalina: Keyboard-Mapping for PC Keyboards not working

Beitrag von „LetsGo“ vom 15. Juli 2021, 15:18

[Nimral](#)

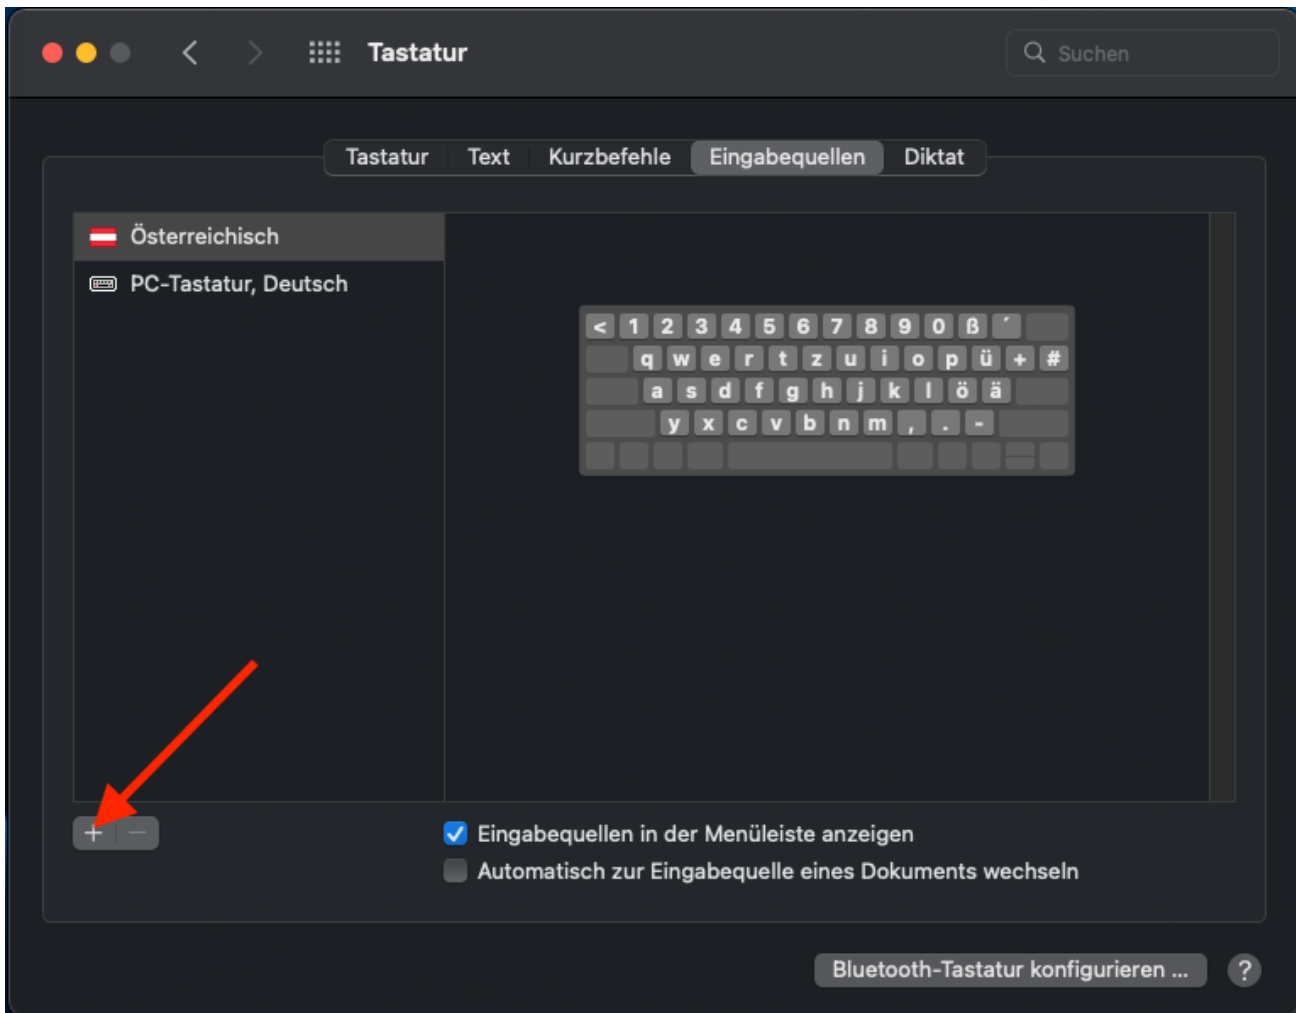

It worked for me on Monterey.

- 1) move the PC-Tastatur,Deutsch.keylout file to the Keyboard Installer Window
- 2) click somewhere in this area to install the layout for the current user or on the right side for all users.

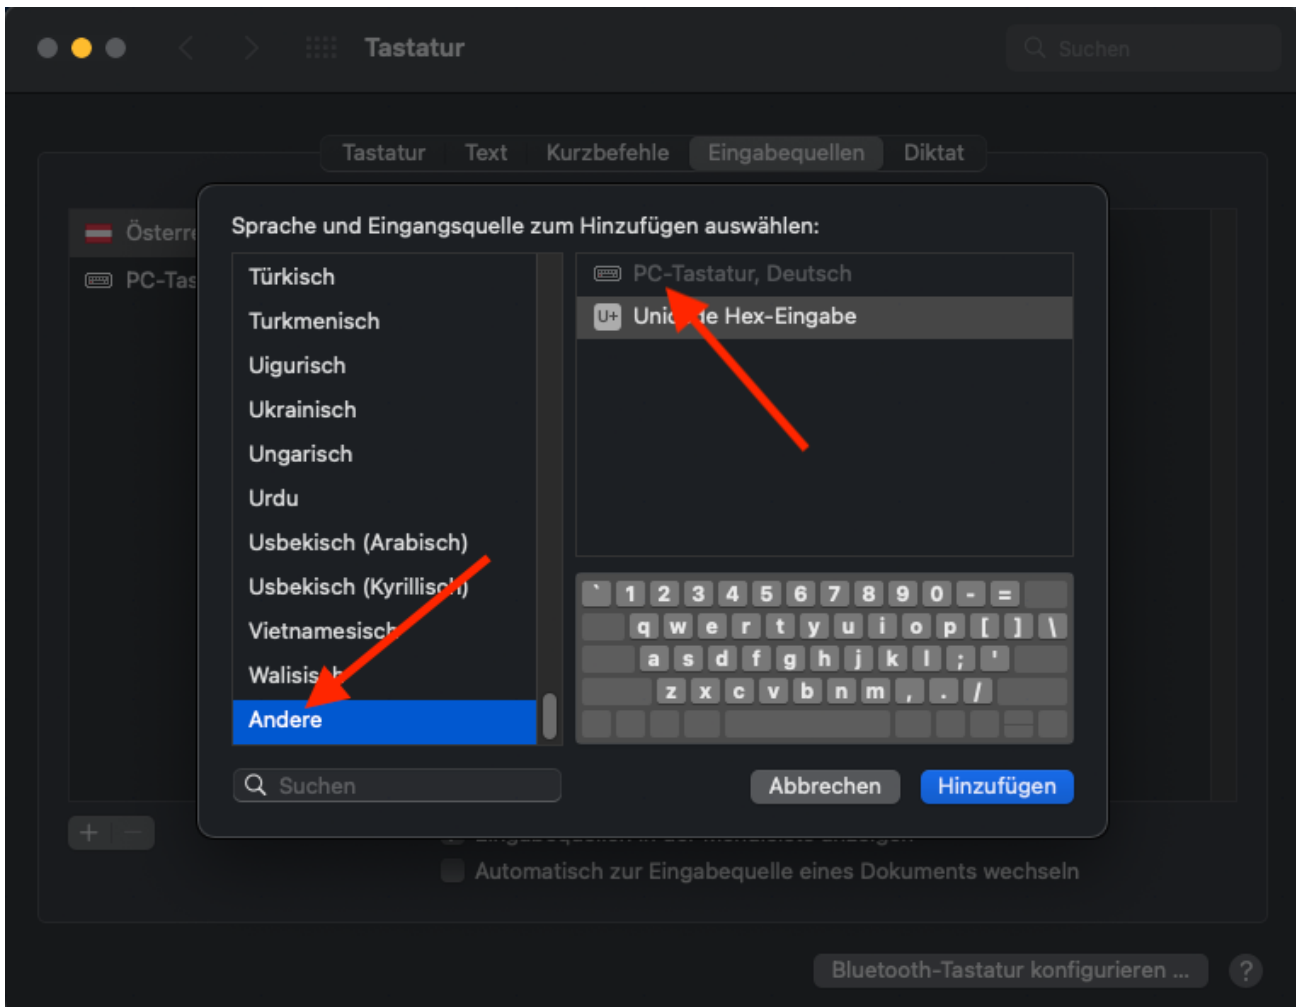

Go to SystemSettings/Keyboard/Input Sources

click the + button

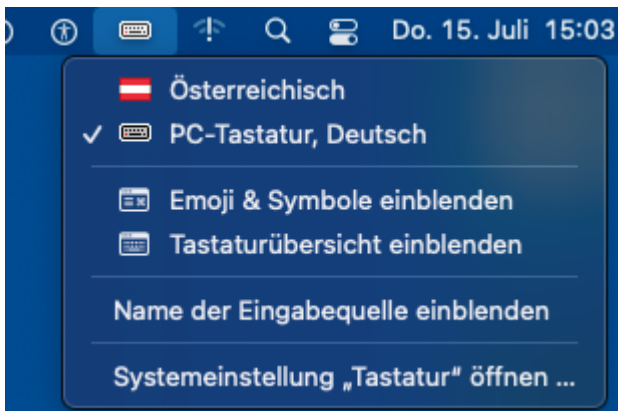

Go to Others. Add your imported layout (PC-Tastatur, Deutsch)

In this case is greyed out, because it`s already in use.

Select the new layout.

At the end i remapped also a few keys with [karabiner](#) elements!

You also could simply copy the .keylayout file to /Library/Keyboard Layouts or use users/[username]/Library/Keyboard Layouts and go through the steps above.

/Library/Keyboard Layouts is the same as using the "Install for all users" button in the Keyboard Installer.app

/users/[username]/Library/Keyboard Layouts is the same as using the "Install for current user" button in the Keyboard Installer.app

But first you have to make this folder visible. It is hidden by default!!!!

So the App just copy the .keylayout file into one of the folders. You can do this easily by drag and drop. So it`s really not necessary do use the App.
