Hi [Dec_Bra1n](#),

no prob. Wer are humans, so we can talk to each other. 😉

Your <u>weakest link</u> in this chain is your connection to the Internet Service Provider, 100Mbs. (On the other side, you have great technique on your site. Fibre, 1Gbit router, ...)

Your 93 Mbit is only a <u>little bit lower</u> than 100. Less than 10%. So you can't expect very more.

Why don't you upgrade your plan to a higher level? With your equipment you can get <u>very much</u> higher. (Obey: Your LAN-card and cable should then be higher than 100 Mbs, too. Otherwise you have another bottle-neck)

No prob again. We are here to help. Just ask.

Harry. 😎

I suggest now, that you have measured by LAN. WiFi connections are depended on a lot of things. Distance, walls, etc. When you measure with your WiFi, too, we can look at it.
