Ok so I installed Big Sur just for fun and directly after install I deleted it and installed Sierra again.

So I did not have any experience with Big Sur.

But as I can see in your config.plist file there are a few things you should change:

- 1) Delete the Devices in "DeviceProperties -> Add". You don't need them to just start or install Big Sur.
- 2) "Kernel -> Add": Lilu.kext should be the first in the list, VirtualSMC.kext should be the second.
- 3) You could try to change "Misc -> Security -> SecureBootModel" from "Default" to "Disabled"
- 4) I did not see "Whatevergreen.kext" in your "Kernel -> Add" list. But since you have an AMD GPU the kext should be there
- 5) you should add at least "-v" to "NVRAM -> 7C436110-AB..... -> boot-args"

I think there are a few other options to change to be able to boot Big Sur with this configuration but I don't know exactly

which one. But the right options should be explained at Dortanias Guide.

A good way to test the configuration is this [Open Core Sanity Checker Tool](#). It's for OC 0.6.6 but I don't care and even

test my 0.8.1 config.plist with it - it should be fine I guess.

Another thing is your SSD. I think this Motherboard can not boot directly from NVMe.

I have modified my BIOS to achive this function.

Also it could be a problem if you are using my EFI folder with another BIOS version than me.

To be honest I don't believe that but a few people would say that you should check that your BIOS is the same Version than mine.

That's a few guesses from me which you can try. But I am no Big Sur expert. If you can't boot you should open an extra Thread on that topic.

Oh yeah and I see that in your opencore log file:

Zitat

```
00:000 00:000 AAPL: #[EB.H.IS|!] Err(0xE) <- RT.GV boot-signature 7C436110-AB2A-4BBB-A880-FE41995C9F82
```

```
00:011 00:011 AAPL: #[EB.H.IS|!] Err(0xE) <- RT.GV boot-image-key 7C436110-AB2A-4BBB-A880-FE41995C9F82
```

signature and key stuff... I don't know but this security signature crap could mean there is something wrong with your Big Sur [Install stick](#) I believe.
