

Hackintosh läuft trotz Fehlern in OCConfigCompare - Ignorieren?

Beitrag von „Vostec“ vom 6. September 2021, 12:44

Habe eine EFI aus dem Netz geladen und minimal verändert, damit sie auf meinem Rechner läuft (Setup in meiner Signatur). Konnte erfolgreich Big Sur mit OpenCore 0.7.2 installieren und bisher funktioniert alles, was ich testen konnte: WLAN, USB 2.0, USB 3.0, Audio und Grafik.

Kexte und Treiber habe ich manuell auf die aktuellsten (nightly) Versionen aktualisiert.

In einem Tutorial wurde empfohlen in Fällen wie meinen das Tool OCConfigCompare zu benutzen, da die ursprüngliche config.plist womöglich nicht mehr aktuell ist. In der Tat gab es viele Einträge, die gegenüber der sample.plist fehlen oder hinzugefügt wurden. Habe bereits gegoogelt um die Bedeutung der Einträge herauszufinden, jedoch werde ich daraus leider nicht schlau. Könnte jemand sich den Log anschauen und mir sagen ob ich Einträge in meiner config.plist ändern sollte und falls ja welche?

LG
