[TheWachowski](#) my was not a criticism to the choice of that kind of benchmark.

Only in the past it was proven it does not reflect well "power and speed" real life and it was possible also to cheat to have better performance, I do not remember but I think downloadfritz explain here or in other forum as data hub could interfere in this benchmark

About FPS difference, it is weird because I thought a 3950x (but also your CPU @5Ghz) could do better with that NVME (I use a sabrent rockets 4.0)

I have also better result with s sabrent rocket 3.0 (better than [Aluveitie](#) speed) but I do not know if he uses PBO and in that condition... in my case it is only enabled on bios
