Beelink U55 "Hack Mini" - inkl. EFI

Beitrag von „rweise“ vom 2. Oktober 2021, 11:16

Hi Milan,

it is hard to help without an error description . As an example there are some cpus that always ends on a IGPU error (Cris Versions do so!). For this, you can use my efi from above, that helps for me. but you must fill it with own serials.

(load config.plist from the efi, chose iMac 16,1 in Opencore Configurator [Platforminfo-SMBIOS]and generate Serial Number and UUID - save the config.plist that's all)

And if you like, i can write here a complete howtodo, but the question for me is, have you a working Mac or hackintosh? the OS that my EFI use is Big Sur 11.6 , by the way and i think i can upload a efi with serials for you, if you like.

And after Installation, do not forget to copy the EFI folder in the EFI Drive after setup. That was my error when i start with Hackintosh. You open the Efi and there must be the Folder EFI with BOOT Folder and Clover or OC Folder. For first boot, you can boot from your Stick and select the installation on hdd.

regards René
