

Radeon GPU Temperatur mit VirtualSMC

Beitrag von „Aluveitie“ vom 4. Oktober 2021, 08:05

[fabiosun](#) I've found the responsible code in the Linux driver, it is just not as straight forward as reading the temperature. The temperature can just be read from a specific location. Reading other values requires writing the key you want to read to a specific address and then waiting for the corresponding result.

Should not be that hard to implement, just tricky to get it right as testing it is a little tedious.

Next on my list of todos are now to read the frequency, and provide gpu temperature to VirtualSMC 😊
