

Radeon GPU Temperatur mit VirtualSMC

Beitrag von „fabiosun“ vom 7. Oktober 2021, 12:21

I am studying my max temperatures using Davinci resolve to see in that condition my GPU throttles ..GPU works well and I have no problems at all but I suspect it throttles..and I don't like this

I think it is throttling also in Luxmark3.1

By the way , your 6900xt is a reference AMD card?

If so, have you posted your power table settings?

I have some problem in windows to follow interesting guide posted in this forum
