

# Radeon GPU Temperatur mit VirtualSMC

Beitrag von „fabiosun“ vom 7. Oktober 2021, 13:07

[Aluveitie](#)

your Powertable settings working well here

About 10\* less in 66 nodes (candle Benchmark) maybe about 7% slower using this frequency and undervolt

Maybe I ask if you have refined temperatures reading, I am asking because I can't see now GPU on its maximal value (95° for hot spot sensor without powertable setting)

However thank you so much..I have to study better "how to" to find less conservative value than yours...

Very happy about it.. almost like when I managed to get OSX working with my 3970x long ago

Vielen Dank
