

Radeon GPU Temperatur mit VirtualSMC

Beitrag von „Aluveitie“ vom 7. Oktober 2021, 13:20

[fabiosun](#) It's pretty simple though. Start Unigine Valley and use MSI Afterburner to try different settings. With the HUD you can track frequency, temperature and power usage as you tune the sliders.

Once you find the settings that suite you and don't crash the benchmark you can enter them into the MorePowerTool and write the SPPT to the registry and extract it from there.
