

# OpenCore Sammelthread (Hilfe und Diskussion)

Beitrag von „cobanramo“ vom 15. Oktober 2021, 11:19

Das hat indirekt mit MacOS version was zu tun, es geht um APFS Driver die veraltet/angreifbar sind.

Ich persönlich finde es sowieso bissl quatsch zu raten jedesmal die Sicherheit auszuhebeln anstatt die Ursache zu nennen und zu raten das man die Build updaten soll.

```
5. MinDate
Type: plist integer
Fallback: 0
Description: Minimal allowed APFS driver date.

The APFS driver date connects the APFS driver with the calendar release date. Apple ultimately drops support for older macOS releases and APFS drivers from such releases may contain vulnerabilities that can be used to compromise a computer if such drivers are used after support ends. This option permits restricting APFS drivers to current macOS versions.

• 0 -- require the default supported release date of APFS in OpenCore. The default release date will increase with time and thus this setting is recommended. Currently set to 2021/01/01.
• -1 -- permit any release date to load (strongly discouraged).
• Other -- use custom minimal APFS release date, e.g. 20200401 for 2020/04/01. APFS release dates can be found in OpenCore boot log and kApfsLib.

6. MinVersion
Type: plist integer
Fallback: 0
Description: Minimal allowed APFS driver version.

The APFS driver version connects the APFS driver with the macOS release. Apple ultimately drops support for older macOS releases and APFS drivers from such releases may contain vulnerabilities that can be used to compromise a computer if such drivers are used after support ends. This option permits restricting APFS drivers to current macOS versions.

• 0 -- require the default supported version of APFS in OpenCore. The default version will increase with time and thus this setting is recommended. Currently set to allow macOS Big Sur and newer (160000000000000000).
• -1 -- permit any version to load (strongly discouraged).
• Other -- use custom minimal APFS version, e.g. 1412101001000000 from macOS Catalina 10.15.4. APFS versions can be found in OpenCore boot log and kApfsLib.
```

Nur dort wo man den Build nicht updaten kann/will sollte man das mit Datumsangabe diesen halt exklusiv zulassen.

Hier bei mir habe ich ja auch ein Catalina, BigSur und Monterey im Einsatz;
