

# Asus Prime X299-Deluxe

Beitrag von „maschinenwart“ vom 17. Oktober 2021, 14:58

...habe folgende Befehle im Terminal eingegeben

```
Preparations

In macOS:

Before we get in too deep, we'll want to first ready our system:

sudo pmset autopoweroff 0
sudo pmset powernap 0
sudo pmset standby 0
sudo pmset proximitywake 0
sudo pmset tcpkeepalive 0
```

...dieses Bootargument hinzugefügt

```
• Misc -> Boot -> HibernatEMode -> None
  • We're gonna avoid the black magic that is S4 for this guide
• NVRAM -> Add -> 7C436118-AB2A-4BBB-AE08-FE41995C9F82 -> boot-args
  • keepssys=1 - Makes sure that if a kernel panic does happen during sleep, that we get all the
    important bits from it
  • swi0_panic=1 - Avoids issue where going to sleep results in a reboot, this should instead give
    us a kernel panic log
```

...dieses "agdpmod=pikera" herausgenommen

..."RestrictEvents.kext" deaktiviert
