

OpenCore Sammelthread (Hilfe und Diskussion)

Beitrag von „kru102“ vom 18. November 2021, 01:04

Danke. Ich versuche es mal..

... Nicht geklappt. Ich habe vergessen: Ich habe OC 0.7.6., da ist das ein neue Eintrag UIScale.

```
-----
13. UIScale
Type: plist_integer_8bit
Path: /_UI/UIScale
Description: User interface scaling factor.
Corresponds to 401E8028-38C7-446A-9008-49CC8B38C14. UIScale variable.
  • 1 -- 1x scaling, corresponds to personal displays.
  • 2 -- 2x scaling, corresponds to HiDPI displays.
  • -1 -- forces the current window to scale up.
  • 0 -- automatically chooses scaling based on the current resolution.
Note 1: Automatic scale factor detection works on the basis of total pixel area and may fail on small HiDPI displays, in which case the value may be manually managed using the NVRAM action.
Note 2: When switching from manually specified NVRAM variable to this preference an NVRAM reset may be needed.
14. UgaPassThrough
```
