

Sleep-Wakeproblem: Hängt sich auf....

Beitrag von „5T33Z0“ vom 23. Dezember 2021, 15:07

Würde mal die Option ACPI\Quirks\ResetHwSig aktivieren.

"The Hardware Signature item of the FACS.aml form is a 4-byte hardware signature, which is calculated after the system boots based on the hardware configuration.

If this value is changed after the machine wakes up from a Hibernate state, the system will not recover correctly. The patch works by setting the Hardware Signature = 0 to resolve this issue."
