Mac OS X auf diesem System

Beitrag von „Juliaan“ vom 16. Juli 2013, 13:52

Habe mal ein Zitat gefunden

"Apple added support for the 7000 series of AMD Radeon HD graphics cards last week, in [version 10.8.3 of OS X Mountain Lion](#).

Prior to this, 7000-series graphics cards did not work properly in Mac OS X; while you could still boot a Hackintosh with these cards, you couldn't view your computer screen in full resolution or run any applications that required graphics acceleration. With this new support in Mac OS X, however, 7000-series graphics cards have finally become a practical option for your Hackintosh.

"
