[Zitat von Mo-6420](#)

you are welcome

And thanks for you too...

Heyy i have successfully have graphics working on Catalina with over 300MB Vram now

- First i completely disable [SIP](#) (with opencore NVRAM config, clear Nvram in opencore boot menu after changes) (and remember to change [bios settings](#) to uefi boot because reset nvram resets this setting)

this way of disabling [SIP](#) is from opencore official guide and it doesn't require booting into recovery

- then i download the legacy video patch:
<https://drive.google.com/file/d/1tDwOXUftXgsf4CQGR1dHvcOun5JsO0a3/view?usp=sharing>

- just run the pkg and install it, reboot and i now have 384mb vram
