I ll testing the HT DSDT later.

With Hyperthreading Enabled, the Performance is in some Applications on Windows like CyberPunk 2077 not so good. (Setting High with HT - 40 FPS/ without HT 70 -80 FPS)

Maybe some RGB light on the RAM or FANs will increase it 😊 Thats why HT is turned off in my system.

After the 12.2 Beta Update the Bug with Networkenvironment is fixed.

So everything is working for me. WoW i am still impressed.
