

# Problem with booting macOS Monterey

Beitrag von „apfel-baum“ vom 20. Januar 2022, 21:04

hello [Elgzar2](#) ,

your screenshot , systeminfo is worthless, without knowing your exactly software (for example current bootloader, osx-build-version) , hardware specs (for example nic, mainboard.. ) we could not help neither nor less.

please do following steps :

- 1,- boot directly to windows- -not- with the oc or clover bootpicker - use for example hwinfo64 (download it before) , save the log, up it to the post here.
- 2. - fill in the system hw specs into your signature, profile - that will help you -for now and later, also the helpers

indeed, we do not sit behind or beside you, so we could not know this all by default , so this informations are needed to operate

thanks,
