"Der neue Weg" macOS zu nutzen oder "The new way of building a Hackintosh"

Beitrag von „fabiosun" vom 10. Februar 2022, 14:07

I started the virtualization path with ProXmoX because my CPU was not supported by the OpenCore memory manager at the time

I agree with everything written by [Aluveitie](#)

Let me just say that the only thing that needed to be reserved for ProXmoX was some memory

I was running all the CPU for full 64 threads

Just losing one would be unacceptable to me!

The performances are comparable to a "Bare Metal" system, you can only have some weird audio crackle if you stress your CPU (eg with 3D rendering software)

For some types of AMD CPUs even better in terms of graphics performances (virtualizationdoes not require a patch (kernel fix pat))

Speaking of Ms. youtuber, I wrote my guide on ProXmoX just for her and her annoying telenovelas to catch customer without saying any useful information and only denigrating Hackintosh community

taking away from her greedy clutches many trx40 users, these users spent absurd amounts with her without receiving anything most of the time

Even with this video yesterday he didn't show much, especially regarding the creation of a VM in OSX

Initially copying only the values it had in an excel sheet for the basic configuration of ProXmox

Unfortunately, many users do not use google properly and are sometimes caught by "smoke" sellers
