

Luxusproblem: Bootzeit. Pause von 40Sek bei "bootroot" in Monterey 12.1

Beitrag von „spacepilot3000“ vom 13. Februar 2022, 11:12

LÖSUNG, klappt bei mir (auch ohne NVRAM reset):

Those who are suffering to slow boot issues in Monterey due to NVMe please read this post carefully:

For fixing that slow boot issue you can follow the following steps:

Update OC to 0.7.9 (Oc 0.7.8 or lowers does not work with the fix)

In config.plist go to kernel > Quirks > SetApfsTrimTimeout

set the value from -1 to 0

Save

Reboot and reset Nvram.

It should fix your issue.

N.B:

This fix works only with OC 0.7.9 (Till today's date 12-02-2022)

Tested with latest Monterey stable 12.2.1 (Till today's date 12-02-2022)
