

Lenovo Yoga C740 Stuck on MACH Reboot

Beitrag von „EdD1024“ vom 2. März 2022, 12:24

This is my EFI for the C740. I'm not sure how well it is working, I think sleep still does not so you will also probably have to adopt it to your needs, as it is a different model. I strongly advise you to deactivate pcidevices.aml as it probably doesn't fit to your laptop.

System Info	
Host	C740.local
OS	macOS Catalina Version 10.15.7 (Build 19H1715)
Kernel	Darwin 19.6.0 x86_64
RAM	16.00 GB
Model Identifier	MacBookPro16,1
CPU	Intel(R) Core(TM) i7-10510U CPU @ 1.80GHz
Intel Generation	Coffee Lake

Unpack the EFI with Keka. You might have to rename them to EFI.zip.001 and EFI.zip.002

It will probably not work but this is the most I can do at the moment.

Cheers
