

# BCM94352HMB - Custom Kext for Monterey

Beitrag von „Petabyte“ vom 5. März 2022, 11:30

Versuche kext zu erstellen weil alle andere nicht funktionieren.

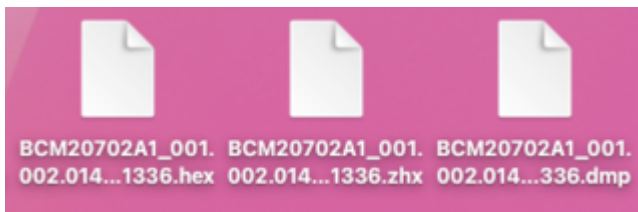

ich habe die Anleitung gefolgt von [github](#) aber ich bin stecken geblieben bei Kext mod.

Darum bitte ich Forum um Hilfe dabei.

Ich habe schon die data umwandelt wie in Github howto aber jetzt muss es in ein kext verbindet werden.

iMac Pro (2017)

VID\_413C&PID\_8143

- Using a plist editor create a new firmware key under the BcmFirmwareStore/Firmwares dictionary.

Note that the version number displayed in macOS is the last number in the file name (1457 in our sample) + 4096.

So in this case the firmware version in macOS would be: "c14 v5553".

- After configuring a key under BcmFirmwareStore/Firmwares, add your device ID as a new device for BcmPatchRAM.

Firmwares can also be loaded directly from BcmFirmwareRepo.kext/Contents/Resources, either by firmware key name (see above), or by naming the file with just the vendor and device-id. For example, 0930\_0223.hex (uncompressed) or 0930\_0223.zhx (compressed).

Copying an existing IOKit personality and modifying its properties is the easiest way to do this. Configure the earlier firmware using its unique firmware key.
