Mac OSX mit AMD Prozessor

Beitrag von „fabiosun" vom 10. April 2022, 08:25

If you want to try again

use this EFI and post a screenshot if it hangs

Are you installing from an USB stick?

Have you some NVME disk in your system?

I am asking because some MSI board working also in Monterey loose some NVME m2 slot while worked well with previous OS like Big Sur

I advice you to use this EFI for your trying because it is set with latest open core 079 and latest AMD kernel patches

And obviously also because it was tested in system similar to yours

if you see after verbose a black screen maybe you have to add pikera boot arg in config.plist boot arg section
