

Wo genau ist meine Frage richtig: Update von 10.13.6 auf 10.15.7 läuft nicht sauber, vielleicht gleich auf Monterey?

Beitrag von „fabiosun“ vom 10. April 2022, 11:51

This EFI has Kernel Patches to instal and boot from HighSierra to Monterey

If you have a stick with a full installer you should have the chance to complete your installation

in bios I would enable 4G and disable CSM)

If it hangs post a photo

thank you

EDIT:

I apologize if I misunderstood reading among the various messages

ProvideCurrentCpuInfo quirk we are talking about is mandatory to enable it if you use the new kernel patches Unless you use some old patches (not recommended)

Gigabyte motherboard may need boot arg npci = 0x2000 (or 4G enabled in Bios)

Your GPU may need the boot arg pikera
