

Wo genau ist meine Frage richtig: Update von 10.13.6 auf 10.15.7 läuft nicht sauber, vielleicht gleich auf Monterey?

Inside your zip I see alt-EFI and EFI

and many many things not useful also in high sierra for us (nullcpupowermanagement kext)

if this old EFI does not work anymore you have to put back all parameters in your bios when it is was (luckily) working and to have it booting well again in your system
