Bootargs:

e1000=0 (damit wir der Apple 210er Treiber genommen)

Mir sagt dk.e1000=0 was

boot-args	Description
	Disables <code>com.apple.driver.k10-AppleEthernet2000</code> (Apple's DEXT driver) from matching to the Intel i225-V Ethernet controller found on higher end Comet Lake boards, causing Apple's i225-kevt driver to load instead.
dk.e1000=0	This boot argument is optional on most boards as they are compatible with the DEXT driver. However, it is required on Gigabyte and several other boards, which can only use the kevt driver, as the DEXT driver causes hangs. You don't need this if your board didn't ship with the i225-V NIC.
